

Chapter 9

The Time Value of Money

Besley & Brigham

Chapter 9- Learning Objectives

- ✓ Identify various types of cash flow patterns (streams) that are observed in business.
- ✓ Compute (a) the future values and (b) the present values of different cash flow streams and explain the results.
- ✓ Compute (a) the return (interest rate) on an investment (loan) and (b) how long it takes to reach a financial goal.
- ✓ Explain the difference between the Annual Percentage Rate (APR) and the Effective Annual Rate (EAR) and explain when each is more appropriate to use.
- ✓ Describe an amortized loan and compute (a) amortized loan payments and (b) the balance (amount owed) on an amortized loan at a specific point during its life.

Time Value of Money

- ✓ The principles and computations used to revalue cash payoffs at different times so they are stated in dollars of the same time period
- ✓ **The most important concept in finance** used in nearly every financial decision
 - ✓ Business decisions
 - ✓ Personal finance decisions

Cash Flow Patterns

- ✓ **Lump-sum amount** – a single payment paid or received in the current period or some future period
- ✓ **Annuity** - A series of **equal** payments that occur at equal time intervals
- ✓ **Uneven cash flow stream** – multiple payments that are **not equal**, do not occur at equal intervals, or both conditions exist

Future Value

The amount to which a cash flow or series of cash flows will **grow over** a period of time **when compounded** at a given interest rate.

Future Value

- ✓ How much would you have at the end of one year if you deposit \$700 in a bank account that pays 10 percent interest each year?

$$FV_n = FV_1 = PV + INT$$

$$= PV + PV(r)$$

$$= PV (1 + r)$$

$$= \$700(1 + 0.10) = \$700(1.10) = \$770$$

What's the FV of an initial \$700 after three years if $r = 10\%$?

Finding FV is Compounding

Future Value

After 1 year:

$$\begin{aligned}FV_1 &= PV + \text{Interest}_1 = PV + PV(r) \\ &= PV(1 + r) \\ &= \$700(1.10) \\ &= \$770.00\end{aligned}$$

After 2 years:

$$\begin{aligned}FV_2 &= FV_1(1 + r) \\ &= [PV(1 + r)](1 + r) \\ &= PV(1 + r)^2 \\ &= \$700(1.10)^2 = \$700(1.2100) \\ &= \$847.00\end{aligned}$$

Future Value

After 3 years:

$$\begin{aligned}FV_3 &= FV_2(1 + r) \\ &= [PV(1 + r)^2](1 + r) \\ &= PV(1 + r)^3 \\ &= \$700(1.10)^3 = \$700(1.331) \\ &= \$931.70\end{aligned}$$

In general, $FV_n = PV(1 + r)^n$

Three Ways to Solve Time Value of Money Problems

- ✓ Use Equations
- ✓ Use Financial Calculator
- ✓ Use Electronic Spreadsheet

Numerical (Equation) Solution

$$FV_n = PV(1 + r)^n$$

PV = \$700, r = 10%, and n = 3

$$\begin{aligned} FV_n &= \$700(1.10)^3 \\ &= \$700(1.3310) = \$931.70 \end{aligned}$$

Financial Calculator Solution

The equation $FV_n = PV(1 + r)^n$ is programmed into the calculator; you must provide the numbers for the calculator to perform the computation

Financial Calculator Solution

Here's the setup to find FV:

INPUTS	3	10	-700	0	?
	N	I/Y	PV	PMT	FV
OUTPUT					931.70

Clearing automatically sets everything to 0, but for safety enter $PMT = 0$.

Spreadsheet Solution

The input values must be entered in a specific order: I/Y, N, PMT, PV, and PMT type (not used for this problem).

The screenshot shows an Excel spreadsheet titled "Figure 9-2.xlsx" with the "FORMULAS" ribbon selected. The spreadsheet contains the following data:

	A	B	C	D
1	N =	3		
2	I/Y =	0.10		
3	PV =	-700.00		
4	PMT =	0		
5	PMT Type	0 (0 = ordinary annuity; 1 = annuity due)		
6	FV =	?		
7			The equation used to solve for FV_3 in cell B8	Values that correspond to the cells referenced in cell C8
8	$FV_3 =$	931.70	=FV(B2,B1,B4,B3,B5)	=FV(0.1,3,0,-700,0)
9				

The formula bar shows the formula for cell B8: $=FV(B2,B1,B4,B3,B5)$. The status bar at the bottom indicates "READY" and "100%".

Future Value of an Annuity

- ✓ **Annuity:** A series of payments of equal amounts at equal intervals for a specified number of periods.
- ✓ **Ordinary (deferred) Annuity:** An annuity whose payments occur at *the end* of each period.
- ✓ **Annuity Due:** An annuity whose payments occur at *the beginning* of each period.

Ordinary Annuity versus Annuity Due

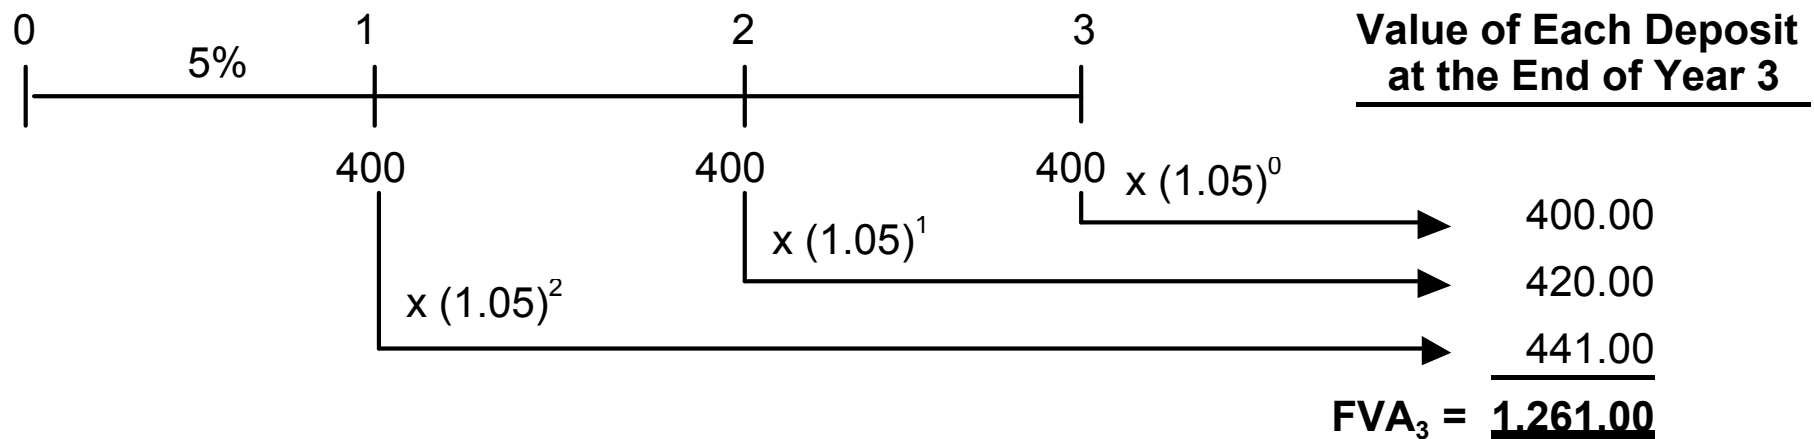

Ordinary Annuity

Annuity Due

FV of a 3-year Ordinary Annuity of \$400 at 5%

Numerical Solution

$$FVA_n = PMT \left[\sum_{t=0}^{n-1} (1+r)^t \right] = PMT \left[\frac{(1+r)^n - 1}{r} \right]$$

$$\begin{aligned} FVA_3 &= \$400 \left[\frac{(1.05)^3 - 1}{0.05} \right] \\ &= \$400(3.1525) = \$1261.00 \end{aligned}$$

Financial Calculator Solution

INPUTS	3	5	0	-400	?
	N	I/Y	PV	PMT	FV
OUTPUT					1,261.00

Spreadsheet Solution

The screenshot shows an Excel spreadsheet titled "Figure 9-3 - Excel" with the following data:

	A	B	C	D
1	N =	3		
2	I/Y =	0.05		
3	PV =	0		
4	PMT =	-400		
5	PMT Type	0 (0 = ordinary annuity; 1 = annuity due)		
6	FV =	?		
7			The equation used to solve for FV_3 in cell B8	Values that correspond to the cells referenced in cell C8
8	FVA ₃ =	1,261.00	=FV(B2,B1,B4,B3,B5)	=FV(0.05,3,-400,0,0)
9				

The formula bar for cell B8 shows: $=FV(B2,B1,B4,B3,B5)$

The spreadsheet is titled "FVA Computation" and the status bar shows "READY" and "100%".

FV of a 3-year Annuity Due of \$400 at 5%

Numerical Solution—FVA(DUE)

$$FVA(DUE)_n = PMT \left\{ \left[\frac{(1+r)^n - 1}{r} \right] \times (1+r) \right\}$$

$$\begin{aligned} FVA(DUE)_3 &= \$400 \left\{ \left[\frac{(1.05)^3 - 1}{0.05} \right] \times (1.05) \right\} \\ &= \$400(3.310125) = \$1,324.05 \end{aligned}$$

Financial Calculator Solution—FVA(DUE)

INPUTS	3	5	0	-400	BGN ?
	N	I/Y	PV	PMT	FV
OUTPUT					1,324.05

Spreadsheet Solution—FVA(DUE)

The screenshot shows an Excel spreadsheet titled "Figure 9-3-due - Excel". The ribbon is set to "HOME". The formula bar shows the formula $=FV(B2,B1,B4,B3,B5)$ for cell B8. The spreadsheet data is as follows:

	A	B	C	D	E
1	N =	3			
2	I/Y =	0.05			
3	PV =	0			
4	PMT =	-400			
5	PMT Type	1	(0 = ordinary annuity; 1 = annuity due)		
6	FV =	?			
7			The equation used to solve for FV_3 in cell B8	Values that correspond to the cells referenced in cell C8	
8	FVA(DUE) ₃ =	1,324.05	$=FV(B2,B1,B4,B3,B5)$	$=FV(0.05,3,-400,0,0)$	
9					

The spreadsheet also shows a text box in cell C8 explaining the equation used to solve for FV_3 in cell B8, and a table in row 8 showing the values that correspond to the cells referenced in cell C8.

Future Value of an Uneven Cash Flow

Numerical Solution

$$FVCF_n = CF_1 (1+r)^{n-1} + CF_2 (1+r)^{n-2} + L + CF_n (1+r)^0 = \sum_{t=1}^n CF_t (1+r)^{n-t}$$

Solving for interest r and n

- ✓ The variables in the equations are labeled PV, FV, r , n , and PMT
- ✓ If we know the values of all of these variables except one, we can solve for the unknown variable

If an investment of \$100 grows to \$165.50 in eight years, what rate of return is earned?

Solve for r in the following equation:

$$FV_n = PV(1 + r)^n$$

$$\$165.50 = \$100(1 + r)^8$$

Financial calculator solution:

INPUTS

8

?

-100

0

165.50

N

I/Y

PV

PMT

FV

OUTPUT

6.5

If sales grow at 12.25% per year, how long before sales double?

Solve for n:

$$FV_n = 1(1 + r)^n$$

$$2 = 1(1.1225)^n$$

Financial calculator solution:

INPUTS	?	12.25	-1	0	2
	N	I/Y	PV	PMT	FV
OUTPUT	6.0				

Present Value

- ✓ **Present value** is the **value today** of a future cash flow or series of cash flows.
- ✓ **Discounting** is the **process of finding the present value** of a future cash flow or series of future cash flows; it is the **reverse of compounding**.

What is the PV of \$935 due in three years if $r = 10\%$?

Numerical Solution

Solve $FV_n = PV (1 + r)^n$ for PV:

$$PV = \frac{FV_n}{(1+r)^n} = FV_n \left(\frac{1}{1+r} \right)^n$$

$$\begin{aligned} PV &= \$935 \left(\frac{1}{1.10} \right)^3 \\ &= \$935(0.7513) = \$702.48 \end{aligned}$$

Financial Calculator Solution

INPUTS	3	10	?	0	935
	N	I/Y	PV	PMT	FV
OUTPUT			-702.48		

Either PV or FV must be negative.

Here $PV = -702.48$; invest \$702.48 today, take out \$935 after 3 years.

Spreadsheet Solution

The screenshot shows an Excel spreadsheet titled "Figure 9-5 - Excel". The ribbon is set to the "FORM" tab. The spreadsheet contains the following data:

	A	B	C	D
1	N =	3		
2	I/Y =	0.1		
3	PV =	?		
4	PMT =	0		
5	PMT Type	0	(0 = ordinary annuity; 1 = annuity due)	
6	FV =	935		
7			The equation used to solve for PV in cell B8	Values that correspond to the cells referenced in cell C8
8	FVA ₃ =	-702.48	=FV(B2,B1,B4,B6,B5)	=FV(0.05,3,0,935,0)
9				

The formula bar for cell B8 shows: `=PV(B2,B1,B4,B6)`

The status bar at the bottom indicates "READY" and "100%" zoom.

Present Value of an Annuity

- ✓ PVA_n = the present value of an annuity with n payments
- ✓ Each payment is **discounted**, and the **sum of the discounted payments** is the present value of the annuity

PV of a 3-year Ordinary Annuity of \$400 at 5%

Numerical Solution

$$PVA_n = PMT \left[\sum_{t=1}^n \frac{1}{(1+r)^t} \right] = PMT \left[\frac{1 - \frac{1}{(1+r)^n}}{r} \right]$$

$$\begin{aligned} PVA_3 &= \$400 \left[\frac{1 - \frac{1}{(1.05)^3}}{0.05} \right] \\ &= \$400(2.72325) = \$1089.30 \end{aligned}$$

Financial Calculator Solution

INPUTS	3	5	?	400	0
	N	I/Y	PV	PMT	FV
OUTPUT			-1,089.30		

We know the payments but there is no lump sum FV, so enter 0 for future value.

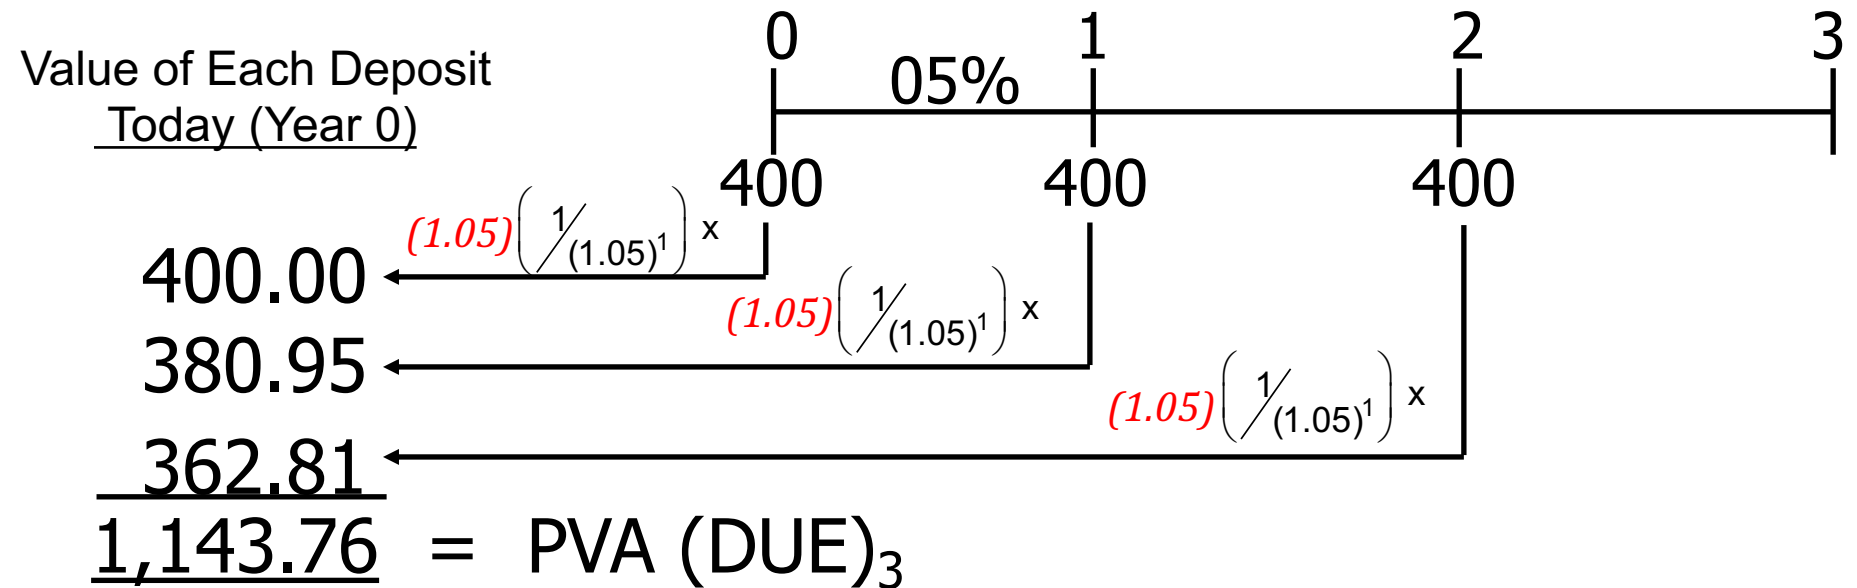

Spreadsheet Solution

The screenshot shows the Microsoft Excel interface with the following data in the spreadsheet:

	A	B	C	D	E
1	N =	3			
2	I/Y =	0.05			
3	PV =	?			
4	PMT =	-400			
5	PMT Type	0	(0 = ordinary annuity; 1 = annuity due)		
6	FV =	0			
7			The equation used to solve for PV in cell B8	Values that correspond to the cells referenced in cell C8	
8	FVA ₃ =	1,089.30	=FV(B2,B1,B4,B6,B5)	=FV(0.05,3,400,0,0)	
9					

The formula bar shows the formula for cell B8: `=PV(B2,B1,B4,B6)`.

Present Value of an Annuity Due

Numerical Solution—PVA(DUE)

$$\text{PVA(DUE)}_n = \text{PMT} \left\{ \left[\frac{1 - \frac{1}{(1+r)^n}}{r} \right] \times (1+r) \right\}$$

$$\text{PVA(DUE)}_3 = 400 \left\{ \left[\frac{1 - \frac{1}{(1.05)^3}}{0.05} \right] \times (1.05) \right\} = 400(2.85941) = 1,143.76$$

Financial Calculator Solution—PVA(DUE)

Switch from “End” to “Begin”.

Then enter variables to find $PVA_3 = \$1,143.76$

					BGN
INPUTS	3	5	?	-400	0
	N	I/Y	PV	PMT	FV
OUTPUT			1,143.76		

Spreadsheet Solution—PVA(DUE)

Uneven Cash Flow Streams

- ✓ A series of cash flows in which the amount varies from one period to the next:
 - ✓ **Payment (PMT)** designates **constant cash flows**—that is, an annuity stream.
 - ✓ **Cash flow (CF)** designates cash flows in general, **both constant** cash flows and **uneven** cash flows.

Present Value of Uneven Cash Flow Stream

Numerical Solution

$$PVCF_n = CF_1 \left[\frac{1}{(1+r)^1} \right] + CF_2 \left[\frac{1}{(1+r)^2} \right] + \dots + CF_n \left[\frac{1}{(1+r)^n} \right] = \sum_{t=1}^n CF_t \left[\frac{1}{(1+r)^t} \right]$$

$$PVCF_n = \frac{400}{(1.05)^1} + \frac{300}{(1.05)^2} + \frac{250}{(1.05)^3} = 400(0.95238) + 300(0.90703) + 250(0.86384)$$

$$= 380.952 + 272.109 + 215.960 = 869.02$$

Financial Calculator Solution

- ✓ Input in “CF” register:
 - ✓ $CF_0 = 0$
 - ✓ $CF_1 = 400$
 - ✓ $CF_2 = 300$
 - ✓ $CF_3 = 250$

- ✓ Enter $I = 5\%$, then press NPV button to get
NPV = 869.02. (Here NPV = PV)

Spreadsheet Solution

- ✓ Setup the spreadsheet so that the cash flows are ordered sequentially
- ✓ Use the NPV function to solve for the present value of the non-constant cash flow series.

Spreadsheet Solution

The screenshot shows an Excel spreadsheet with the following data:

Year	Cash Flow			NPV
1	400			
2	300		r = 0.05	
3	250		NPV =	\$869.02

The formula bar shows the formula $=NPV(E3, B2:B4)$ entered in cell E4. The spreadsheet title is "NPV Cor" and the status bar shows "READY" and "100%".

Semiannual and Other Compounding Periods

- ✓ **Annual compounding** is the process of determining the future (present) value of a cash flow or series of cash flows when interest is added (computed) **once per year**.
- ✓ **Semiannual compounding** is the process of determining the future (present) value of a cash flow or series of cash flows when interest is added (computed) **twice per year**.

Compounding

- ✓ Will the FV of a lump sum be larger or smaller if we compound more often, holding the stated r constant?
 - ✓ If compounding is more frequent than once per year—for example, semiannually, quarterly, or daily—interest is earned on interest. Because interest is compounded more often, **the future value will be larger.**

Comparison of Different Interest Rates

r_{SIMPLE} = Simple (Quoted) Rate

Used to compute the interest paid each period

APR = Annual Percentage Rate = r_{SIMPLE}

APR is a non-compounded interest rate

EAR = Effective Annual Rate = r_{EAR}

The rate that would produce the same future value if annual compounding had been used

EAR for a simple rate of 10%, compounded **semi-annually**

$$\begin{aligned} \text{EAR} = r_{\text{EAR}} &= \left(1 + \frac{r_{\text{SIMPLE}}}{m} \right)^m - 1 \\ &= \left(1 + \frac{0.10}{2} \right)^2 - 1.0 \\ &= (1.05)^2 - 1.0 = 0.1025 = 10.25\% \end{aligned}$$

FV of \$100 after 3 years if interest is 10% compounded **semi-annually**

$$FV_n = PV \left(1 + \frac{r_{\text{SIMPLE}}}{m} \right)^{m \times n}$$

interest is added
(computed) **twice per year**

$$FV_{3 \times 2} = \$100 \left(1 + \frac{0.10}{2} \right)^{2 \times 3}$$

$$= \$100(1.34010) = \$134.01$$

FV of \$100 after 3 years if interest is 10% compounded quarterly

$$FV_n = PV \left(1 + \frac{r_{\text{SIMPLE}}}{m} \right)^{m \times n}$$

$$FV_{3 \times 4} = \$100 \left(1 + \frac{0.10}{4} \right)^{4 \times 3}$$

$$= \$100(1.34489) = \$134.49$$

Fractional Time Periods

Example: \$100 deposited in a bank at $r_{\text{EAR}} = 10\%$ for 0.75 of the year

Financial Calculator Solution

Example: \$100 deposited in a bank at EAR = 10% for 0.75 of the year

INPUTS	0.75	10	-100	0	?
	N	I/Y	PV	PMT	FV
OUTPUT					107.41

Spreadsheet Solution

The screenshot shows an Excel spreadsheet titled "Figure 9-3 - Excel". The ribbon is set to "HOME". The formula bar shows the formula $=FV(B2,B1,B4,B3,B5)$ for cell B8. The spreadsheet data is as follows:

	A	B	C	D
1	N =	0.75		
2	I/Y =	0.10		
3	PV =	-100		
4	PMT =	0		
5	PMT Type	0	(0 = ordinary annuity; 1 = annuity due)	
6	FV =	?		
7			The equation used to solve for FV_3 in cell B8	Values that correspond to the cells referenced in cell C8
8	$FVA_3 =$	107.41	$=FV(B2,B1,B4,B3,B5)$	$=FV(0.05,3,-400,0,0)$
9				

The spreadsheet is titled "FV Computation" and the status bar shows "READY" and "100%".

Amortized Loans

- ✓ **Amortized Loan:** A loan that is **repaid in equal payments** over its life; payment includes both principal repayment and interest
- ✓ Amortization tables are widely used to determine how much of each payment represents principal repayment and how much represents interest.
- ✓ Financial calculators (and spreadsheets) can be used to set up amortization tables.

Amortization schedule for a \$15,000, 8% loan that requires three equal annual payments

Step 1: Determine the Required Payments

INPUTS	3	8	15,000	?	0
	N	I/Y	PV	PMT	FV
OUTPUT				-5,820.50	

Step 2: Find Interest Charge for Year 1

$$\text{INT}_t = \text{Beginning balance}_t (r)$$

$$\text{INT}_1 = 15,000(0.08) = \$1,200.00$$

Step 3: Find Repayment of Principal in Year 1

$$\begin{aligned}\text{Repayment} &= \text{PMT} - \text{INT} \\ &= 5,820.50 - \$1,200.00 \\ &= \$4,620.50\end{aligned}$$

Step 4: Find Ending Balance after Year 1

$$\begin{aligned}\text{Ending bal.} &= \text{Beginning bal.} - \text{Repayment} \\ &= \$15,000 - 4,620.50 = \$10,379.50\end{aligned}$$

Repeat these steps for the remainder of the payments (Years 2 and 3 in this case) to complete the amortization table.

Loan Amortization Schedule

\$15,000 Loan at 8 Percent Interest Rate

Year	Beg. of Year Balance (1)	Payment (2)	Interest @ 8% (3) = (1) x 0.08	Repayment of Principal (4) = (2) – (3)	End of Year Balance (5) = (1) – (4)
1	\$15,000.00	\$5,820.50	\$1,200.00	\$4,620.50	\$10,379.50
2	10,379.50	5,820.50	830.36	4,990.14	5,389.36
3	5,389.36	5,820.50	431.15	5,389.35	0.01

The \$0.01 remaining balance at the end of Year 3 results from a rounding difference.

Chapter Principles

Key Time Value of Money Concepts

- ✓ What are the three basic types of cash flow patterns?
 - ✓ Lump-sum amount – a single payment paid or received in the current period or some future period
 - ✓ Annuity - A series of equal payments that occur at equal time intervals
 - ✓ Uneven cash flow stream – multiple payments that are not equal

Chapter Principles

Key Time Value of Money Concepts

- ✓ How are dollars from different time periods compared when making financial decisions?
 - ✓ Dollars from different time periods must be stated in the same “Time Value” before they can be compared.
 - ✓ Dollars can be translated into the same time period by computing either present value or future value.

Chapter Principles

Key Time Value of Money Concepts

- ✓ How is the return on an investment determined?
 - ✓ The return is determined by the rate at which the investment grows over time.
 - ✓ Everything being equal, the current value of an investment is lower the higher the interest rate it earns in the future.

Chapter Principles

Key Time Value of Money Concepts

- ✓ What is the difference between the Annual Percentage Rate (APR) and the Effective Annual rate (EAR)?
 - ✓ APR is a simple noncompounded interest rate quoted on loans.
 - ✓ EAR is the actual interest (compounded) rate or rate of return.

Chapter Principles

Key Time Value of Money Concepts

- ✓ What is an amortized loan?
 - ✓ A loan paid off in equal payments over a specified period.
 - ✓ Each payment includes repayment of some principal and payment of interest.

End of Chapter 9

The Time Value of Money
